

Deconstruction & Salvaging Materials in Existing Buildings

What is Deconstruction and Salvage?

In the simplest sense, *deconstruction* is the opposite of construction. This alternative to demolition involves the dismantling or removal of building materials. It maximizes the recovery of valuable building materials for reuse and recycling and minimizes the amount of waste landfilled.

In some instances, deconstruction is not a viable option, but *salvaging* generally is. Fixtures, doors, lumber, bricks, mechanical units, and other materials within commercial and residential buildings may be individually removed and reused.

Why Deconstruct or Salvage Instead of Demolish?

1. You may pay less to deconstruct than demolish an existing building
2. You may reduce disposal fees
3. You may be able to sell salvaged material
4. You can conserve natural resources (through reuse)
5. You can reduce landfilled materials
6. You can create jobs and training opportunities

Conserve Resources!**

What Steps Do I Take To Pursue Deconstruction or Salvage?

1. Apply for appropriate approval from the Bay Area Air Quality Management District and other necessary agencies.
2. Apply for City of Sunnyvale demolition permit, no additional City permits are necessary
3. Do site walk-through to get an overview of potentially salvageable materials such as machinery, lumber, lighting, and bathroom or kitchen fixtures. Current City codes and City Departments may determine whether some items are reusable.
4. Contact appropriate deconstruction and/or salvage companies; set time schedule for site tour(s) to determine which course of action is most cost-effective
5. Determine salvage and/or deconstruction work to be completed depending on input from companies and set work schedule
6. Complete salvage and deconstruction while awaiting building permit (plan accordingly)
